

Clinical history:

59M presents with cough and hemoptysis ?malignancy

Specimen:

Left lung lower lobe endobronchial biopsy.

Macroscopy:

Received 2 core biopsies measuring 5mm and 7mm. All taken.

Microscopy:

Microscopic examination shows fragments of a necrotic tumour composed of sheets of large pleomorphic atypical cells with vesicular chromatin and prominent nucleoli. Occasional cells show cytoplasmic vacuolations. There is associated necrosis. On immunohistochemistry, the tumour is positive for pan-cytokeratin and TTF-1. P40 is negative.

Final diagnosis:

Left lung lower lobe endobronchial biopsy – lung adenocarcinoma. Further molecular testing to follow.

Supplementary report:

A mutation in EGFR has been detected.

Final diagnosis: Left lung lower lobe endobronchial biopsy – lung adenocarcinoma. EGFR mutated.
