

History and Physical

Chief Complaint:

Acetaminophen overdose

History of Present Illness:

A 30-year-old female is brought to the emergency department by paramedics after reportedly ingesting a large amount of Tylenol at once with water. The exact number of tablets ingested is unknown. The patient states she took only Tylenol and denies ingestion of any other medications, alcohol, or substances. She does not report vomiting, abdominal pain, or altered mental status at the time of evaluation.

Past Medical History:

Not reported

Medications:

None

Allergies:

No known drug allergies

Family History:

Noncontributory

Social History:

No tobacco, alcohol, or illicit drug use reported

Review of Systems:

Constitutional: No fever or chills

Gastrointestinal: No nausea, vomiting, or abdominal pain

Neurologic: No confusion or dizziness

Psychiatric: Reports feeling overwhelmed; denies current suicidal intent but admits to intentional ingestion

Physical Examination:

General: Alert, cooperative, in no acute distress

Vital Signs: Stable

HEENT: No scleral icterus or jaundice

Cardiovascular: Regular rate and rhythm

Respiratory: Clear to auscultation bilaterally

Abdomen: Soft, non-tender, no hepatomegaly

Neurologic: Oriented, no focal deficits

Skin: Warm, dry, no rash

Workup

Laboratory Studies:

Acetaminophen level: 180 µg/mL at 4 hours (plotted on Rumack-Matthew Nomogram)

All other tests pending
